

Unity Developer Assignment

Please create a new project from scratch and complete the 3 tasks below.

1. **“Ace of Shadows”**

Create 144 sprites stacked like cards in a deck, with each top card partially covering the one below. Every 1 second the top card should move smoothly to another stack. Display a counter above each stack and show a message when all animations are finished.

2. **“Magic Words”**

Create a system that combines text and Unicode emojis to render character dialogue using data from the endpoint below. Load the data dynamically at runtime and handle cases where avatar URLs may not load or data is missing.

<https://private-624120-softgamesassignment.apiary-mock.com/v3/magicwords>

3. **“Phoenix Flame”**

Create a particle effect demo that shows a great fire effect. Add a UI button that controls the fire colour using an animator controller. The fire should transition smoothly from orange to green to blue and loop back to orange.

Technical requirements:

- Write your code in **C#** and use **Unity6**.
- Each task should be accessed via an **in-game menu**.
- Render responsively for both **mobile** and **desktop** devices.
- Display the **fps** in the top left corner.
- Build for **WebGL** and provide a **link to the hosted** version of the app.

We evaluate your **project structure, architecture, readability, testability** and **documentation** of your code. But as game developers we also deeply care about the **style**, visual **aesthetics** and **UX** of your solution :)

For questions regarding the test, please reach out to Kristina.

All the best 🚀
